Farmaprama is a brand-name medication commonly used to treat **anxiety disorders and panic attacks**. It contains **alprazolam** as its active ingredient, which belongs to a class of drugs known as **benzodiazepines**.

Alprazolam is the same active compound found in medications like Xanax. Farmaprama is manufactured and distributed primarily in **Mexico and some Latin American countries**, and it is sometimes encountered by travelers or individuals seeking anxiety relief.

Farmaprama works by calming the brain and nervous system, helping reduce excessive fear, tension, and nervousness.
